Cassegrain Reflector System, Ø440 mm WR15 to WR1.9, 44 to 63 dBi Directivity

DESCRIPTION

Anteral's Cassegrain Reflector Systems (CRS) are high frequency parabolic antennas composed by a pyramidal feedhorn antenna, a primary parabolic mirror and a secondary hyperbolical mirror. The feed and the primary mirror are designed to maximize the spillover efficiency while reducing the blockage to the minimum. The secondary mirror is specially manufactured to have the best reflecting surface at the highest frequencies. The whole structure presents a robust design and it is covered with a radome for outdoor applications.

The CRS-440-WRxx models have a main reflector with a diameter of 440 mm and variable directivity from 44 to 63 dBi depending on the selected frequency band. The CRS exhibits a typical maximum crosspolar level of -40dB and Secondary Side Lobes of -17 dB.

APPLICATIONS

The CRS are especially useful for high-capacity data links at the new high frequency bands as well as any application where maximum gain is required. Anteral also offers custom clamping structures. Specific directivity values can be requested. Contact us for further information.

Anteral also offers High Gain Lens Horn Antennas that exhibit also high gain (>40 dB) with minimum size at frequencies from 110 to 330 GHz.

Additional notes

Directivity and radiation pattern data are simulated. Actual values could vary slightly. Return loss data is measured from a sample. Actual values could vary slightly. The return loss performance of all items is checked before delivery.
